

Active Mail

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

Active Mail is a suite of .NET components that allows users to send, receive and parse templated and databound emails using multiple protocols such as SMTP, IMAP4, POP3 and NNTP. It comes with real innovations like the templating feature that allows the ends users of your application to modify all the parameters of the email(s) to send by accessing a text or XML file that the component will load when executed. Advanced databinding feature allows the developer to bind almost every valid datasource. This function combined with templating is unique and powerful.
