Ajax Contact Form

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

With TSPHPFeedback you can insert contact forms on your web pages, that doesn't requires to reload the page to open the form and send the contact message, due an Ajax based implementation. This script is packed inside a Dreamweaver extension, you don't need programming skills to insert it and you need just a click from the Dreamweaver menu. Your server should support PHP and the PHP mail function enabled (most of servers with PHP do).
