

AnyURL

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

AnyURL is a CGI form processing program which provides a trivial way for HTML authors to use CGI forms input to point to URL's without doing any programming. This avoids the need to write a different program for each form (or group of forms), while still being flexible enough to point to URL's containing different access methods, nodes, and object types.
