The APC's ActionApp content management platform allows non-programmers to easily create dynamic web pages and online databases. A web interface is used to manage: Creation of new applications; editing fields; users and groups; HTML output formatting; content sharing. The Action Apps include advanced content syndication functions. These tools make it easy to share content between Action App enabled sites, or other sites that can import content in the APC-RSS XML schema. The Action Apps are not a cookie cutter portal in a box. Rather, they are oriented toward the creation of individual dynamic pages. Each 'App' represents a single page such as an events calendar or a bibliography. Dynamic content is integrated into individual HTML pages using SSI or Java call.
