

# ASP Application Object

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

The Application object is used to control and manage all items that are available to all users of an Active Server application. The Application items can be variables needed for all users in the application, or they can be instantiated objects that provide special server-side functionality. In this tutorial the syntax, collections, methods and events of the ASP Application object are described.
