

# ASP Internet Search Engine

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

Add new content to your website with this mini Google/AltaVista style search engine. The ASP Internet Search Engine comes ready to run with a database already packed with websites. Each line of code is commented to make it easier to customize. Visitors to your site can add their own or favourite websites through an add your own URL page. The Internet Search Engine runs in much the same way as the Search Engines you see on the Internet. It allows the user to either search for websites containing all the words in your search or websites with any of the words in your search. You can set in the code how many returned results are shown on each page. The other pages containing the rest of the search results are linked to using, next, previous, and page number hyperlinks. The hyperlinks to the other pages use the Get method so search results can be bookmarked by the user to return to at a later date.
