ASP Request Object

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

The Request object retrieves the values that the client browser passed to the server during an HTTP request. It is used to get information from the user. Using this object, you can dynamically create web pages and perform various server-side actions based on input from the user. In this tutorial the syntax, collections, properties and methods of the ASP Request object are described.
