SQL2Table is a freeware C++ database COM server dll that takes a connection string and a SQL statement, generating a custom table in HTML format. The target audience is an Active Server Page scripter who wants to automate data retrieval from a relational database over a small corporate intranet. All of the magic is performed on the server, allowing any user with a standard browser to view the data. A complex HTML table can be generated with a few lines of VBScript or JScript code. The dll can automatically generate a navigation bar and detail links for each row. This version includes an ASP script that can be used to test the dll properties.
