

BabelKit Multilingual Code Table

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

BabelKit is an interface to a universal multilingual database code table. BabelKit takes all of the programming work out of maintaining multiple database code definition sets in multiple languages. The code administration and translation page lets you define new virtual code tables, new languages, enter all codes and their descriptions and then translate them into all languages of interest. Perl and PHP classes generate HTML code selection elements in the user's language.
