Include/insert your gif/jpg image inside your PHP script using base64-encoding. This enables you to create a good functional website with images, using only one file: Your php-script. The script itself is also a good example of how this works. Enjoy creating better php-scripts and less files. Added download of your generated code and better information. Nice look, upload functionality, and the ability to save and display code. Latest version update: Bug fix in show code on screen.
