Mobile Number	{value_mobile_number}
Email	{value_email}

The purpose of cgiemail, a CGI program written in C for Unix, is to take the input of WWW forms and convert it to an e-mail format defined by the author of the WWW form, so that the resulting e-mail messages are not difficult to sort through. Using it requires slightly more work than forms-to-email programs with less flexibility in e-mail format. Nevertheless, users with no programming experience can follow the simple step-by-step instructions in the cgiemail user guide.
