<b>Email</b>	{value_email}

Trying to browse to a server that's inaccessible to you? This CGI script may be what you need. It acts as an HTTP proxy, and can be a bridge between a browser and an otherwise inaccessible server. It also makes your requests anonymous, so you can set up your own server like The Anonymizer. Very simple to install; runs in either Perl 4 or Perl 5. Configurable options include cookie support, text-only support, simple ad filtering, custom encoding of target URLs, and more.
