

Check validity of an email adress

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

Before the sending of a mail to avoid a useless excess load on IIS, it is possible to use a simple function to verify that the email address is well formed. In a more pushed process we could be also brought to interrogate the smtp corresponding server to know if the address exists or not.
