

Create Excel on the Server

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This code example demonstrates how to create excel documents on your server. Using the US state info db, after reading the contents of the db instead of writing output to the browser, html text is written to the server with the .xls file extension. A link to the new document is created (in the browser) for easy navigation to the new document. The current time (server time) is also displayed to show that the excel document was created dynamically.
