

# Creating a Website Design Templating System Using PHP

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

Learn how to create a website design templating system using php to be able to easily update different sections on your website by changing only few design files. The tutorial is designed for total beginners, so it is easy to understand and follow. Whether you have a small or a huge website, you know how much hassle and time it takes to upgrade your web site pages. The upgrade process becomes even more irritating when you make a change that needs to be upgraded on every page of your website; a good example of such a change is adding a button to the header or changing the copy right information in the footer of your website. In this tutorial I will show you how PHP comes to the rescue with only few lines of code. You can use this tutorial to be the basis to make your website easier to maintain and upgrade.
