This script allows you to create a client pull slide show from a series of html documents. One particular use may be: Let's say you download a number of pictures and want to create an html file for each graphic in a particular directory; You can then use this script to link each together in a self advancing slideshow. You also have the option of displaying the filenames as HREFs in one frame and the pictures in another, so you don't have to watch the show in a linear fashion.
