To deliver information to a user a site is needed. Web site content should be managed and that involves separation data from its presentation. The task is still often solved with the help of templates in program technologies. Though now we have XSLT technology at our disposal. Any document can be represented with data that is structured in detail with the help of XSL. It is quite enough to report the corresponding XSL template to define a proper graphic presentation for the data. XSL language is polymorphous and permits high flexibility in format changes of documents. This might seem to be St.Grail of web development - we add XSL tools to our arsenal and shorten the time of the project development thus raising its quality. But perhaps we lost sight of a significant something. Read this article about it
