DHTMLX JavaPlanner is an Ajax-powered web control for Java. It allows creating rich-featured attractive event calendars, job schedulers and task managers in Java. It is created on the basis of the available JavaScript dhtmlxScheduler. JavaPlanner can be used as a Java standalone application or can be integrated into any Java project (available in JSP and Grails, Struts and Spring MVC Frameworks). The new release comes with the following updates: customizable time scales, limited events display in the month view, default skin changed to 'terrace', multi-day view updated with overnight events, fixed 'weekly' recurrence pattern, improved data saving process, integration with jQuery and Backbone.
