<b>Email</b>	{value_email}

dhtmlxGrid is a flexible, feature-rich JavaScript datagrid component with Ajax support and powerful API. It provides a client-side solution for displaying, editing, and sorting tabular data. With dhtmlxGrid, you can easily create a cross-browser editable table with draggable columns, multiline headers, multiple cell types, filtering, searching, and grouping capabilities. Smart rendering and paging features allow this grid to work effectively fast with large datasets. With special DataProcessor, the grid data can be easily updated on the server side. All changes made in browser can be automatically applied to the database. There is ready-to use server-side integration for PHP, ASP.NET, Java, and ColdFusion.
