

# Displaying All of the Form Variables

<b>Address</b>	<code>{value_address}</code>
<b>Contact Person</b>	<code>{value_contact_person}</code>
<b>Mobile Number</b>	<code>{value_mobile_number}</code>
<b>Email</b>	<code>{value_email}</code>

This short tutorial describes a little function that is useful in debugging your ASP pages. This function, `FormDataDump()`, outputs all of the form variables being passed into a page. Various options for this function allow the developer to view the values in a 'debugger-style' mode, or in a 'quiet-mode,' in which case the form variable output is hidden from the end user.
