PHP script that allows you to run your own web link directory and also intergrate the ODP RDF dumps into a MySQL database and then search and browse the directory. It can be intergrated into your site using templates. Includes an online administration area to manage the directory. Also supports category moves (catmv), site totals for each category, editor's picks and ThumbShots.org thumbnail previews. The directory software can be used with or without ODP data and can be used as a standalone links directory.
