

## Dynamic (2 level) navigation list

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

The creation of a dynamic nested unordered list without using any JavaScript code is sometimes a problem because the script needs to "remember" the values, sub values and also the query string from previous clicked links. In this tutorial we will learn how to create a dynamic navigation menu powered by PHP and MySQL only. While using standard HTML elements (unordered lists) it's easy to add different CSS styles later.
