

# Dynamically Add Table Rows

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

This example illustrates how to have content altered dynamically. When the user clicks any link it will redraw the section of this page so that another row to the table appears. IE will re-format the page, while NS will allocate a specific region at the load time of the page - it will not re-allocate room later.
