eForum is Java-server based software that enables geographically distant participants to share ideas and enhance teamwork via the Web. It allows project moderators to manage feedback and project discussions. Users can subscribe to groups with email notifications - where each new message is emailed to the subscriber. With messages stored in a database, and classified by topic, it is capable of building a powerful knowledge base. This is an ideal project to tie into the Search Engine component to quickly find information need by searching by keywords, topics, titles, authors' names, descriptions and other criteria. Based on the popular shared standard Expresso Framework.
