If you want to separate PHP from HTML, you need some kind of template engine. vlibTemplate is a template engine. vlibDate easily adds and subtracts date values. You can format date values in different languages (german, english, french, spanish and so on). All examples are written in english. The tutorials are written in german and english. The tutorial will teach you how to use template variables, blocks and loop structures. It will give a short example of modular programming. Some simple and more complicated examples are provided. You will learn how to use vlibTemplate with MySQL, too.
