FAQ Help Center

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This is a sweet little FAQ/Help center that can be integrated into any application. The skin is totally customizable via the included CSS stylesheet, and detailed instructions for placing topics and Q & A's are in the comments at the top of the faq.xml file in the com/assets folder. The animation as you switch between topics is abstracted into a reusable class called ObjectSlider.as. For AIR applications, I suggest changing the TextArea component that is used for the Answer box to , as it handles the parsing of html that is placed between CDATA tags within the xml file. The main application file has nothing but a function that is called on creationComplete of the Application. This function demonstrates how to use the Flex PopUpManager to trigger the FAQ window when say - for example - the user clicks the "help" button in your application. Feel free to contact me for any questions, comments, or for help integrating the component into your application.
