| Mobile Number | {value_mobile_number} |
| Email | {value_email} |

This package is meant to find and replace data in files. The replacer class takes a text data value to be found as well the replacement text. It scans files from a given directory to find and replace the specified data. The replacer class may either scan all files or just the ones that match a given regular expression. It may optionally scan sub-directories recursively. (thx2ml)
