This Flash Communications Server powered FLV Player is suggested for use when wanting to protect the video file being served. Progressive FLV videos are cached on the users computer in thier temporary internet files, this FCS FLV Player connects directly with your Flash Communications Server, preventing cacheing and potential Copyright infringments or file copying. FCS FLV Player is designed for streaming FLV files with Macromedia Flash Communication Server. It only requires the user to have Flash Version 6 player installed. The differrence between a component and an .FLA file is the amount of control you have over the features and design of your video player. A component allows for reusable code to be easily modified from within flash, this is a fast solution to implement video but, you cannot modify or add any additional features or change basic design parts of the player. Our FCS FLV Player with the FLA source code allows you to easily change any of the features or design of the player by editing the code in Flash MX, Flash MX 2004 or Flash MX Pro 2004. We most recently added the autoplay feature on the player as well as multiple versions showing various features and how to use them.
