

# Form Dynamically Display Parts

<b>Address</b>	{value_address}
<b>Contact Person</b>	{value_contact_person}
<b>Mobile Number</b>	{value_mobile_number}
<b>Email</b>	{value_email}

This JavaScript example shows how to create a form that has a portion of the form shown (or hidden) upon certain user events. (radio button selection by the user in this example) Note: Netscape has a problem with embedding a portion of a form inside a DIV/SPAN/LAYER, which is why there are three forms shown here, but once you have the values, its easy enough to pull the information together before running the target of the frame.
