FusionMaps XT help you create interactive and data-driven Maps for all your web applications in JavaScript (HTML5) & Flash. Using FusionMaps XT, you can display geographical data distributed by category, regions or entities. Ideal usage examples are business data like "Revenue by states", website analytics, office locations, flight routes and election results. No matter what script or database you are using, FusionMaps XT works efficiently with all of them. Setting up a map barely takes a few minutes; and doesn't involve anything to do with the source code, even for resizing. FusionMaps XT is part of FusionCharts Suite XT, which also includes charts & gauges to meet all your data visualization needs.
