

Google Map Selector

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This jQuery script lets you easily embed a Google Map on your page that supports switching between multiple addresses. A two column layout is presented by default, with the list of desired addresses on the left column and a Google Map on the right. The script automatically adds a CSS class of "selected" to the selected address's LI container to highlight the current address while updating the "View Larger Map" link below the Google map to the appropriate link as well.
