

How to Configure and Make PHP on FreeBSD

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

These notes describe how to compile a custom-built version of PHP 5 from the source, and replace the stock build on a FreeBSD server from Verio VPS. We install useful extensions that can not be loaded as extensions and must be compiled in, specifically tidy and zip. This Apache 2 shared module and CLI versions of PHP are built, but not the CGI version.
