HTML Replace

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

If you're generating pages repeatedly using the same format, or if you want to allow users to easily create data-entry and display screens, this script will do it. You just specify a file on your local hard drive that follows the right format, upload it to the script, and the script generates a form for you to fill in. Submit the form and your values are inserted into the same document and you get finished HTML.
