HTML::Template

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This module attempts make using HTML templates simple and natural. It extends standard HTML with a few new HTML-esque tags. The file written with HTML and these new tags is called a template. It is usually saved separate from your script - possibly even created by someone else. Using this module you fill in the values for the variables, loops and branches declared in the template. This allows you to seperate design - the HTML - from the data, which you generate in the Perl script.
