Convert almost any HTML file to a PostScript document. The HTML is assumed to be W3C 4.0 compliant. Not all HTML files can be accurately converted using this system, so please try the demo to ensure that your file can be converted successfully before using this. You should ensure that you have PHP 4.3 or higher, with the GD libraries installed. Depending on the document that you're converting, you may need to have the JPG and PNG extensions enabled, too. This script is provided to the PHP community by Darren's \$5 Script Archive as a community service. After using so many GPL resources in my own work, I figured that it's about time that I give something back! Good luck with html2ps (PHP version!)
