The HTML5 Media Picture Gallery is a grid form photo gallery with Vimeo and YouTube support. It is a gallery of fixed height (the height will be set based on the number of rows) that will adapt to fit the browser's width regardless of the screen resolution. The gallery can have any number of images and each image can be of any size, but proportional to a base thumb width and height. When an image is clicked or touched, it will open a lightbox window with the a bigger version of the image, YouTube or Vimeo video, or just a simple link (the link url and target can be specifcied). This gallery is using the GPU (hardware acceleration), the rendering speed and performance is impeccable on desktop computers and most importantly on mobile devices. Amazing performance on mobile devices, you can see in the video demo that it runs just like a native app!, it was coded and optimized for mobile devices and it is 100% mobile compatible and of course it will run just as great on PC.
