

HTMLTemplate Object

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

The HTML Template Object is a lightweight class whose sole purpose is to completely separate HTML from server side ASP code. Through the use of special HTML templates, a web page can be created by setting the parameters of the HTMLTemplate object to match those found within the chosen HTML template. There are also several system and environmental variables available to a template file in addition to any user created template variables although these can be disabled to speed up processing of the templates.
