Email	{value_email}

IDS is a CGI written in Perl that generates a photo album website on the fly. All you need to provide are the images and (optionally) text descriptions. As you add new pictures, they will appear automatically. Each image will be displayed with information such as image type, file size, image size, and date uploaded. If EXIF information is embedded in the image (shutter speed, aperature, focal length, etc.), it will be displayed. It will create thumbnail preview images for JPEG, PNG, and GIF images. It will also recognize and display QuickTime movies, MPEG movies, and MP3 files. IDS uses HTML templates, so you can easily customize the look of your site.
