InstaCounter is a counter script, written in PHP, that uses a MySQL database to store all settings. It enables you to add unlimited counters, and define a style for each. You can add unlimited styles by adding a piece of HTML code for each number. This way you can make your counter image or graphical, or text based, or even invisible. Also you can enable a timer counter, which starts counting on a certain date. You can can adjust almost any setting, including the way repeat visitors are handled, which IP addresses to be ignored, public settings, the styles list, individual counter information and statistics, etc. There are also basic individual counter statistics, global statistics, and a top 10.
