ShoppingCart is a highly configurable shopping cart system with web enabled back-end management features. The program uses cookies to identify users when they leave and then return to your site. ShoppingCart allows multiple drop down options for products that can affect price. The back end features include the ability to edit all product, shipping and tax information from a web browser and also to upload product photos and thumbnails. ShoppingCart allows you to directly link to any individual product or category of products from static HTML pages or from within ShoppingCart itself while maintaining state. ShoppingCart will run on Unix and Windows servers.
