JavaCounter

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

This is a Java counter and clock in one applet. It counts page hits, tells your visitors the local time, and provides an analog time display. You can use your own counter sets. Because Java applets cannot write to files, the counter function of JavaClock requires you to install a Perl script (provided) on your Web site. The counter supports any number of pages and/or users. JavaCounter can get along without digit graphics. It optionally generates text and digits internally.
