JavaBY Template Engine (JBYTE) is a general template engine used for generating any type of text document from a template. JavaBY Template Engine is used mostly for generating HTML from JSPs or servlets but it can also be used for generating XML, RTF, WML, e-mail text, source code and configuration files. Using JavaBY Template Engine in cooperation with JavaServer Pages instead of standalone JavaServer Pages means that you can completely separate your content from your markup, as the originators of markup languages intended. The difference between JavaBY Template Engine and JSP is that content can be generated outside a webserver and that the layout is completely separated from the application code.
