JEmailValidator is for checking against email address and sending email

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

Syntax Check-Validates the address for syntax, whether it has all of the mandatory characters present (e.g. @) and any illegal characters present (i.e. ~). It will also check for multiple occurrences of required characters (i.e. @@). DNS/MX Record Check-Validates the domain name with DNS server to ensure that the email domain is a valid registered domain. Mail Server Check-Validates an email address (e.g. ) by mail server (e.g. mail.hotpop.com) to ensure that the mail server indeed has the email address. This method has very good performance. (Attention: a few mail servers don't support this method(e.g. yahoo))
