

MailForm

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

MailForm is an easy-to-use CGI program for Windows that sends the results of a submitted form as an email message. It is primarily designed for use with an online registration form (and includes the ability to verify that a credit card is a valid number), but can be used for any form. MailForm requires that there be a SMTP mail server accessible from the web server machine.
