Mobile Number	{value_mobile_number}
Email	{value_email}

The MBH Log Initialization Servlet is a very handy servlet for initializing logging facilities in your application. By configuring this servlet to 'load-on-startup' first, all your servlets and tag libraries within the web.xml can rely on this initialization. Using this servlet is as simple as configuring it in your web.xml so that it knows where to find your log4j intialization properties file.
