This program generates a static standalone W3C HTML5/CSS3 website from a regular file system structure, focusing on media files (images, audio files, video files and text files). In each directory, a HTML file is created, embedding an audio-video player and a playlist made of all the compatible media files found at this level. An explorer view is also proposed in order to open and download files, as well as to navigate to the other directories. This program makes use of ExifTool and ImageMagick. Supported html5 and flash players are jPlayer, CodeBaseHero, DewPlayer and XspfPlayer.
