This JavaScript example shows how to create a "dynamic" updated field on the page. The updated field happens to be a table in this example, and the background is shown to show you it's entire field. Netscape requires that the size of the field be defined upon the page's creation - IE doesn't care and can resize the field dependant upon the data placed into it as it is placed into it. This script is designed specifically for IE. Netscape would, but requires special if statements to have different accesses to the objects.
