Mp3Splt is a command line utility that splits an mp3/ogg file selecting a begin and an end time position, without decoding. It's very useful to split large mp3/ogg to make smaller files or to split entire albums to obtain original tracks. If you want to split an album, you can select split points and filenames manually, with silence detection, or you can get them automatically from CDDb (internet or a local file) or from .cue files. Otherwise it can be used as a AlbumWrap extractor, infact if you have a file created either with Mp3Wrap or AlbumWrap you can extract tracks just in few seconds. Supports VBR mp3.
