

Multiple Form Selection

Address	{value_address}
Contact Person	{value_contact_person}
Mobile Number	{value_mobile_number}
Email	{value_email}

Allowing multiple choices of data elements enables people to customize views of your data and adds value to your applications. In this sample code, user inputted choice(s) are added to the basic sql statement to draw them from the db. Since the input from the dropdown menu comes through comma delimited it is simply written into the statement without modification. Two simple for next loops determine which elements are part of the record set and displays them accordingly.
