MyDownloader is Java applet for downloading multiple files and folders. You can download the files by selecting the download location with a file dialog or you can use drag and drop. A great feature is that files can drag and dropped to a program. For example, if you drag and drop a text file to Notepad the file will be immediately visible. This is not possible with other downloaders. Other features are: file renaming and thumbnails. The downloader is secure (HTTPS). During download a progressbar is visible. Although the applet is written in Java you can perfectly use it on a PHP, ASP or .NET web site.
